### Remediation Steps

---

#### Microsoft Windows

Configure the system to enable or require SMB signing as appropriate. The method and effect of doing this is system specific so please see [this TechNet article](#) for details. Note: ensure that SMB signing configuration is done for incoming connections (Server).

#### 5. Secure the SNMP installation

##### Remediation Steps

1. If you do not absolutely need SNMP, disable it. SNMP versions 1 and 2c are inherently insecure. SNMP version 3 provides more complex authentication and encryption.
2. If you must use SNMP be sure to use complex and difficult to guess community names. Use the same policy for community names as you use for passwords.
3. Try to make all your MIB's read only. This will limit the damage an attacker can do to your network.

## 6. Secure the SNMP installation on Cisco IOS

### Remediation Steps

1. For SNMP Servers running on Cisco IOS, a Cisco IOS Software upgrade should be performed as a permanent fix for this vulnerability.
2. Alternatively, create an Embedded Event Manager policy to remove the hard-coded SNMP community names using the following steps:
  3. event manager applet cisco-sa-20100707-snmp
  4. event timer countdown time 30
  5. action 10 cli command "enable"
  6. action 20 cli command "configure terminal"
  7. action 30 cli command "no snmp-server community public RO"
  8. action 40 cli command "no snmp-server community private RW"
  9. action 50 cli command "end"
  10. action 60 cli command "disable"
  11. action 70 syslog msg "Hard-coded SNMP community names as per Cisco Security Advisory cisco-sa-20100707-snmp removed"
